

# DERMI NATURAL HEALTHCARE PVT LTD

## MASTER REPLIT WEBSITE BUILD PROMPT

Production-ready brief based on the currently supplied brand/logo source image. Product pack images will be uploaded separately later.

|                                  |                                                        |
|----------------------------------|--------------------------------------------------------|
| Brand                            | Dermi Natural Healthcare Pvt Ltd                       |
| Brand families visible in source | GLETSY / GLETSY GLOW / NEUTOGLOW / NEUTOZINC           |
| Current source assets            | Website/logo image + product information sheet image   |
| Additional assets later          | Individual product pack/product images                 |
| Contact shown in source          | Email: derminatural@gmail.com   Help Line: 91372 77233 |

### COPY THIS ENTIRE PROMPT INTO REPLIT AI / AGENT

**The following is written as a single master instruction. It is deliberately detailed so the build does not collapse into the usual generic template that humanity somehow keeps calling a website.**

You are the lead product designer, senior frontend engineer, UX architect, brand designer, accessibility specialist, and performance engineer for the official website of Dermi Natural Healthcare Pvt Ltd.

Build a premium, trustworthy, modern healthcare / wellness / dermatology-product website using the source material and brand assets attached to this Replit project.

#### IMPORTANT WORKFLOW:

1. I have currently attached the official website/brand logo image.
2. I will upload the individual product images later.
3. Start the complete website structure now using the logo and the exact product information transcribed in this prompt.
4. When I upload individual product images later, make the product cards/details automatically use the correct uploaded image assets without changing the overall design system.
5. Do not invent product photographs, fake packaging, fake testimonials, fake certifications, fake awards, fake medical outcomes, fake statistics, or unsupported claims.
6. Do not replace the supplied logo with a new logo or AI-generated logo.
7. Do not use random stock photos as if they represent this company or its products.
8. Build real, polished UI, not a prototype-looking scaffold.

# 1. BRAND + VISUAL DIRECTION

Use the supplied logo as the source of truth for visual identity. The current logo uses a refined serif/monogram presentation with a leaf motif and a navy, gold, and silver/grey palette.

- Primary visual mood: premium, clinical, elegant, natural, trustworthy, modern, restrained.
- Preferred palette: deep navy for primary brand surfaces and typography, warm gold for highlights, soft silver/grey for secondary accents, clean white and very light neutral backgrounds.
- Avoid loud purple, neon gradients, excessive glassmorphism, cartoon styling, clutter, and template-like generic SaaS aesthetics.
- Use generous spacing, strong hierarchy, subtle borders, soft shadows, tasteful radii, and refined typography.
- Do not overuse gold. Gold should feel like an accent, not like the website was dipped in wedding decoration.
- Use a premium serif display font paired with a clean modern sans-serif body font if available in the project, or use strong web-safe / Google-font alternatives that preserve the same feel.
- Design must work beautifully on desktop, tablet, and mobile.
- Make the interface feel like a real established healthcare brand, not a student project.

## Logo handling requirements

- Place the official logo prominently in the header and footer.
- Preserve aspect ratio, whitespace, and visual clarity.
- Create a consistent logo lockup for desktop and compact mobile header.
- Never stretch, distort, recolor, or redraw the supplied logo.

## 2. PRODUCT INFORMATION EXTRACTED FROM THE PROVIDED SOURCE IMAGE

Use this text as the initial product catalog content. Preserve the spelling shown in the supplied source. Where a future product image provides clearer pack text, use the pack image only to refine the product-specific visual details.

### 1. GLETSY GLOW SOAP

Glutathione + Kojic Acid + Vitamin-E

### 2. GLETSY FACE WASH

Glutathione + Kojic Acid + Olive Oil

### 3. GLETSY ACNE FACE WASH

Salicylic Acid + Teatree Oil

### 4. GLETSY CREAM

Glutathione + Kojic Acid + Mullberry

### 5. GLETSY MOISTURISER

Aquaporin Booster + Cicaf Extract + Willo Bark Extract

### 6. GLETSY SUNSCREEN CREAM

Ceto Stearyl Alcohol; Benzophenone-3; Avobenzone; Ethylhexyl Salicylate; C12 Alkyl Benzoate

### 7. NEUTOGLOW - B

Biotin 10mg

### 8. NEUTOGLOW - G600

Glutathione 600mg; Vitamin C 20mg

### 9. NEUTOGLOW - G100

Glutathione 100mg; Vitamin C 100mg

### 10. NEUTOGLOW - VC

Vitamin C Complex 1000 mg

### 11. NEUTOZINC - TAB

Multivitamin

### Source contact details

- Company: DERMI NATURAL HEALTHCARE PVT LTD
- Email: derminatural@gmail.com
- Help Line: 91372 77233

**The supplied source image does not clearly show a physical postal address. Do not invent one. Keep the address area hidden or marked for later content until an official address is provided.**

### 3. WEBSITE INFORMATION ARCHITECTURE

Build the site as a real multi-page experience with a shared design system and reusable components. Suggested navigation:

- Home
- About Us
- Products
- GLETSY
- NEUTOGLOW
- NEUTOZINC
- Contact

#### Header behavior

- Desktop: logo left, clean navigation center/right, primary contact CTA.
- Mobile: compact logo, hamburger menu, clear close behavior, touch-friendly targets.
- Header should become visually compact on scroll without losing the logo or navigation.
- Add subtle sticky behavior and smooth anchor transitions.

#### Footer behavior

- Repeat logo, company name, contact email, help line, navigation links, product family links, and legal placeholders.
- Use clear copyright text and a minimal footer grid.

## 4. HOME PAGE - DETAILED EXPERIENCE

The homepage must immediately communicate credibility, product discovery, and the brand's natural + healthcare positioning.

### Hero section

- Large premium headline built around the brand rather than an unverified medical promise.
- Supporting line explaining that the site showcases Dermi Natural Healthcare Pvt Ltd and its product families.
- Primary CTA: Explore Products.
- Secondary CTA: Contact Us.
- Place the supplied logo/brand visual carefully. Use future product imagery only after I upload the product assets.
- Add restrained decorative leaf/organic geometry inspired by the existing logo motif, but do not copy the logo into random places.

### Brand introduction

- Short section introducing Dermi Natural Healthcare Pvt Ltd using only information provided by the company.
- Keep copy concise, professional, and factual.

### Product families

- Create three visual family groupings: GLETSY, NEUTOGLOW, NEUTOZINC.
- Each family card should have a short description based strictly on the available ingredient/product information.
- Use placeholders for family imagery until the official product images are uploaded.

### Featured products

- Show selected products in a premium 3- or 4-column responsive grid.
- Product card: image area, product name, short formula/ingredient line, View Details CTA.
- Do not show a fabricated price, availability status, dosage recommendation, or treatment claim.

### Trust / quality section

- Use careful, factual wording such as product information, ingredient transparency, easy contact, and clear catalog navigation.
- Do not invent GMP, ISO, dermatologist-tested, clinically proven, organic, cruelty-free, or regulatory certifications unless later supplied by the company.

## 5. PRODUCTS CATALOG + PRODUCT DETAIL PAGES

This is the core of the website. Make the product catalog feel premium and extremely easy to browse.

### Catalog requirements

- Category / family filters for GLETSY, NEUTOGLOW, and NEUTOZINC.
- Search bar that searches product names and ingredient text.
- Responsive grid with clean card hierarchy.
- Optional sort control, but do not add fake sort logic that has no meaningful effect.
- Product image placeholder system must be easy to replace once the official pack images are uploaded.

### Product detail page requirements

- Large product image/gallery area.
- Product name and family badge.
- Formula / ingredient summary.
- Dedicated sections for key ingredients / composition text where supplied.
- Product description area using factual copy.
- Contact / enquire CTA.
- Back to products navigation.
- Related products from the same family.
- Mobile sticky CTA can be used if it improves usability.
- Never provide medical diagnosis or treatment instructions.

### Data architecture

- Store product content in a centralized structured data file or typed model so new products can be added without rebuilding individual page components.
- Use stable product slugs.
- Every product entry should support: id, family, name, description, ingredients, image, gallery, highlights, and status fields.
- Keep image fields replaceable and local-asset friendly.

## 6. ABOUT PAGE

- Present Dermi Natural Healthcare Pvt Ltd in a refined company profile layout.
- Use only verified information supplied in the project materials.
- Avoid writing a fake founding story, fake mission dates, fake factory claims, or fake geographic footprint.
- Create sections for company overview, product philosophy, families, and contact access.
- A small timeline or milestones component may be included only as an empty, editable structure for later official data.

### Suggested tone

Confident, human, scientific where appropriate, but not exaggerated. The website should sound like a company with standards, not a miracle-cure sales page.

## 7. CONTACT PAGE

- Display company name: DERMI NATURAL HEALTHCARE PVT LTD.
- Display email: derminatural@gmail.com.
- Display help line: 91372 77233.
- Create a simple enquiry/contact form with name, phone/email, subject, and message.
- Add validation, accessible labels, clear success/error states, and spam-safe frontend behavior.
- Because no official postal address is visible in the current source, do not fabricate a map or address.
- Use click-to-email and click-to-call behavior on supported devices.

## 8. UX / UI QUALITY BAR

- Use 8px-based spacing logic or a similarly consistent spacing system.
- Keep content widths controlled. Avoid long unreadable text lines.
- Create a strong type scale for display, section heading, body, labels, and captions.
- Use subtle entrance animation only where it improves the experience. Respect prefers-reduced-motion.
- Hover states must be understated and premium.
- Cards should have visible hierarchy without excessive shadows.
- Buttons must look clickable and provide focus-visible states.
- Use iconography consistently. Avoid mixing unrelated icon families.
- Use semantic HTML headings in proper order.
- Make all interactive components keyboard accessible.
- Ensure sufficient color contrast.

### Do not do these things

- No fake testimonials.
- No fake customer counts.
- No fake review stars.
- No invented doctors.
- No fabricated clinical statistics.
- No fake certifications or compliance badges.
- No countdown timers, fake scarcity, or manipulative sales UI.
- No giant wall of marketing text.

## 9. TECHNICAL IMPLEMENTATION

Use a maintainable frontend architecture appropriate for deployment from Replit. Prefer React + TypeScript + a modern CSS system if that is already established in the project. Do not add unnecessary backend infrastructure just because software developers enjoy assembling machinery.

- Componentize: Header, Footer, Button, ProductCard, ProductGrid, ProductFamilyCard, SectionHeading, ContactForm, ImagePlaceholder, Breadcrumbs.
- Create a shared design token layer for colors, typography, spacing, radius, shadows, and containers.
- Use local assets from the project for official logo/product imagery.
- Optimize all future uploaded product images for responsive display without damaging visible labels.
- Use lazy loading below the fold.
- Use responsive images with appropriate widths.
- Avoid layout shift caused by images without dimensions.
- Do not load unnecessary libraries.
- Keep the code readable and modular.
- Remove unused components, imports, mock data, console noise, and placeholder routes before finalizing.

### Suggested project structure

```
src/  
  components/  
  layout/  
  ui/  
  products/  
  data/  
  products.ts  
  brand.ts  
  pages/  
  Home  
  About  
  Products  
  ProductDetail  
  Contact  
  assets/  
  brand/  
  products/  
  styles/  
  App.tsx
```

## 10. CONTENT RULES + COMPLIANCE GUARDRAILS

- Treat the supplied product names and ingredient/formula lines as source content.
- Preserve ingredient spelling from the source unless a later official asset clearly provides a correction.
- Do not turn ingredients into unsupported disease-treatment claims.
- Do not say a product will cure, permanently remove, reverse, guarantee, or medically treat a condition unless an official claim is supplied.
- Avoid before/after claims unless supplied and legally approved by the business.
- Do not imply prescription or doctor endorsement from the supplied 'Thanks Doctor' graphic unless the company explicitly instructs us to use it that way.
- Legal pages such as Privacy Policy, Terms, Shipping, Returns, Disclaimer, and Refund Policy should be structured as editable placeholders until official company wording is supplied.

### Important source note

The current product sheet visibly includes the phrase 'Thanks Doctor' and the company contact details. Use the provided graphic only where appropriate, but do not infer endorsements, affiliations, or certifications from it.

## 11. PERFORMANCE + SEO

- Target a fast first load on average mobile networks.
- Use semantic page titles and descriptions for Home, About, Products, and Contact.
- Create clean SEO-friendly URLs using readable slugs.
- Add Open Graph metadata with the official company/logo asset when appropriate.
- Use Product structured data only for fields that are actually known. Do not invent price, stock, rating, brand identifiers, or availability.
- Add alt text to every official image based on what is actually shown.
- Do not hide important text inside images.
- Ensure no broken images or dead links.
- Test at common widths including 320px, 375px, 768px, 1024px, 1280px, and large desktop widths.

### Image strategy for future uploads

- I will upload the official product images after the initial build.
- Create an obvious /assets/products or equivalent folder and a predictable naming system.
- When new images are uploaded, map them to product records by slug instead of scattering hardcoded paths throughout components.
- Do not redesign the layout just because the image dimensions vary. Use a robust object-fit strategy that preserves packaging visibility.

## 12. FINAL BUILD CHECKLIST FOR REPLIT

- Inspect all attached source images carefully.
- Use the supplied logo exactly as provided.
- Build the complete responsive website even before product images arrive.
- Seed the catalog with the exact product names and ingredient/formula information above.
- Leave elegant, intentional image placeholders until official pack images are supplied.
- Do not use random stock product images as substitutes.
- Check every navigation link.
- Check mobile menu behavior.
- Check focus states and keyboard navigation.
- Check typography, alignment, spacing, and responsive breakpoints.
- Check console for runtime errors and warnings.
- Check image loading and alt text.
- Check that the contact email and help line are correct.
- Check that no physical address is fabricated.
- Check page performance and reduce unnecessary JavaScript.
- Prepare the project so I can upload the remaining official product images later with minimal code changes.

### Definition of done

**The site should look like a finished, premium corporate healthcare/wellness brand website, not a work-in-progress. Every visible element should have a reason to exist, every interaction should work, and every factual statement should be traceable to supplied source material or an explicitly editable placeholder.**

## 13. FIRST RESPONSE / EXECUTION BEHAVIOR

After reading this prompt, do not spend the whole interaction describing what you plan to do. Start by inspecting the attached logo/source asset, inspect the existing Replit project, identify the current stack, then implement the website in the existing architecture where practical.

- First inspect the codebase and existing asset folders.
- Then establish the global design system.
- Then build the shared header/footer.
- Then build Home, About, Products, Product Detail, and Contact.
- Then seed product data from the source sheet.
- Then connect the supplied logo asset.
- Then perform responsive and accessibility cleanup.
- Then run a final build/test pass and fix errors.
- When I later upload product images, replace the placeholders with those official images while preserving the established design.

### One final instruction

Do not ask me to rewrite this prompt or repeatedly request information that is already present here. Build from what is known, leave clearly marked editable placeholders for what is genuinely missing, and keep the implementation ready for the next batch of official assets.
